

Medical Report

Patient Information:

Name: John Doe

Age: 35 years old

Gender: Female

Address: 123 Main St, Anytown, USA

Date of admission: 2023-10-27

Chief Complaint:

The patient presents to the clinic with complaints of fatigue, abdominal pain, and weight loss.

History of Present Illness:

John Doe is a 35-year-old female who reports feeling fatigued for the past several weeks. She also reports abdominal pain, which she describes as a dull ache in the right upper quadrant of her abdomen. The patient reports a significant unintentional weight loss of 10 pounds over the past month. She denies any nausea, vomiting, or changes in bowel habits.

Past Medical History:

John Doe has a past medical history of hypertension, hyperlipidemia, and depression. She reports no known allergies.

Physical Examination:

The patient appears tired but is otherwise in no apparent distress. On physical examination, there is mild tenderness to palpation in the right upper quadrant of the abdomen. No masses or hepatosplenomegaly are appreciated. The rest of the physical examination is unremarkable.

Diagnostic Studies:

Laboratory studies reveal elevated liver enzymes, including alanine aminotransferase (ALT) and aspartate aminotransferase (AST). Abdominal ultrasound demonstrates a 4 cm hypoechoic mass in the right lobe of the liver.

Assessment and Plan:

The patient was diagnosed with a liver mass, likely malignant, and was referred for further evaluation and management. A computed tomography (CT) scan of the abdomen and pelvis with contrast was ordered to further evaluate the mass and rule out any metastatic disease. The patient was also referred to an oncologist for further management.

Conclusion:

John Doe presented to the clinic with symptoms of fatigue, abdominal pain, and unintentional weight loss, and was diagnosed with a liver mass. Further evaluation with CT scan and referral to an oncologist was recommended.
